

## 14. CURVED INTERFACES

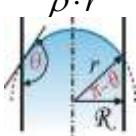

$$p_i - p_e = \frac{2\gamma}{r}$$

$$h = \frac{2\gamma \ell g \cos \theta}{\rho^{(\ell)} g \mathcal{R}}$$

convex surface

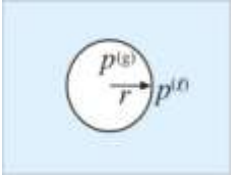

$$RT \ln \frac{p_r^s}{p_\infty^s} = \frac{V_m^\ell \cdot 2 \cdot \gamma}{r} = \frac{M \cdot 2 \cdot \gamma}{\rho \cdot r}$$

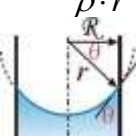

$$r = \frac{\mathcal{R}}{\cos \theta}$$

$$RT \ln \frac{(c_i)_r}{(c_i)_\infty} = \frac{2\gamma \cdot V_m^{s,\ell}}{r}$$

concave surface

$$RT \ln \frac{p_r^s}{p_\infty^s} = -\frac{V_m^\ell \cdot 2 \cdot \gamma}{r} = -\frac{M \cdot 2 \cdot \gamma}{\rho \cdot r}$$

$$r = \frac{\mathcal{R}}{\cos(\pi - \theta)}$$

### Equilibrium conditions on curved interfaces – Capillary elevation and depression

#### Problem 14-01 Pressure difference on curved phase boundary - Laplace-Young equation

Calculate the pressure inside the drop of a liquid of density with radius of  $6 \mu\text{m}$  floating in the air (temperature  $35^\circ\text{C}$ , pressure  $102.1 \text{ kPa}$ ). The liquid density is  $0.93 \text{ g cm}^{-3}$  and surface tension  $42 \text{ mN m}^{-1}$ .

$$[p^{(i)} = 116.1 \text{ kPa}]$$

#### Problem 14-02 Capillary elevation

The stems of roses growing in the garden are about  $50 \text{ cm}$  in length. The cell walls are interwoven by a network of small canals (capillaries) enabling the water transport in plants. You can assume that water completely wets the walls of these capillaries and the average *diameter* of capillaries is  $80 \mu\text{m}$ . Estimate if due to the capillary elevation can water climb up to the bloom. Surface tension of water is  $72.6 \text{ mN m}^{-1}$  and its density  $0.998 \text{ g cm}^{-3}$ .

$$[h = 0.37 \text{ m} - \text{water does not climb up to the blossom}]$$

#### Problem 14-03 Capillary elevation

The surface tension of a certain liquid was determined by the capillary rise measurement. At the temperature of  $25^\circ\text{C}$  the liquid level in the capillary of inner diameter  $0.2 \text{ mm}$  climbed up to the height of  $9 \text{ cm}$  above the planar liquid level in the wide vessel. The measured liquid completely wets the material of the capillary and its density is  $1.076 \text{ g cm}^{-3}$ . Calculate the surface tension of the liquid.

$$[\gamma = 47.5 \text{ mN m}^{-1}]$$

#### Problem 14-04 Capillary elevation

The wall of your cattle shed became wet up to the height of 1.5 m. Assuming the complete wetting, estimate an effective diameter of the pore in the wall. For the surface tension take the value of  $71 \text{ mN m}^{-1}$ , for density  $1 \text{ g cm}^{-3}$ . What pressure you should apply to prevent water from entering the wall?

$$[d = 19.3 \text{ } \mu\text{m}; \Delta p = 14.715 \text{ kPa}]$$

#### Problem 14-05 Capillary elevation between planar surfaces

Calculate the elevation  $h$  between two plane-parallel plates separated by a distance  $d = 0,6 \text{ mm}$ , partially immersed into the liquid (see the attached illustration). The surface tension of the liquid is  $45.6 \text{ mN m}^{-1}$  and its density  $0.886 \text{ g cm}^{-3}$ . Suppose that the plates are so large, that the end effects are negligible and contact angle is zero.

$$[h = 17.5 \text{ mm}]$$

#### Problem 14-06 Contact angle from capillary elevation

To determine the contact angle between glass and a liquid with surface tension of  $18 \text{ mN m}^{-1}$  and density  $\rho = 1.056 \text{ g cm}^{-3}$ , the capillary rise method was used: at the temperature of  $25 \text{ }^\circ\text{C}$  the measured liquid exhibited in a capillary of inner diameter  $0.05 \text{ mm}$  the capillary elevation  $93 \text{ mm}$ . Calculate the contact angle.

$$[\theta = 48^\circ]$$

#### Problem 14-07 Capillary elevation and depression, contact angle

The liquid A with the surface tension  $\gamma_A = 28 \text{ mN m}^{-1}$  and density  $\rho_A = 1.16 \text{ g cm}^{-3}$ , climbs in a glass capillary of the inner diameter of  $0.04 \text{ mm}$  up to the height of  $92 \text{ mm}$  above the level of the liquid in a broad tube.

- Calculate the contact angle of the liquid A on glass.
- A small amount of another liquid, B, with the same surface tension and density, forms on a flat glass plate a drop with the contact angle  $\theta_B = 100.4^\circ$ . How will this liquid behave in a vertical glass capillary – will it exhibit an elevation or a depression? Calculate it.

$$[(a) \theta_A = 68^\circ; (b) \text{ deprese } h_B = -44 \text{ mm}]$$

#### Vapour pressure above the curved interface –Kelvin equation

#### Problem 14-08 Kelvin equation – vapour pressure above a drop

Saturated vapour pressure above a liquid ( $M = 183 \text{ g mol}^{-1}$ ) at the temperature of  $33 \text{ }^\circ\text{C}$  is  $5.2 \text{ kPa}$ . Its surface tension is  $68 \text{ mN m}^{-1}$  and density  $0.88 \text{ g cm}^{-3}$ . What is the vapour pressure above a drop with diameter of  $0.3 \text{ } \mu\text{m}$ ?

$$[p_r^s = 5.6 \text{ kPa}]$$

### Problem 14-09 Kelvin equation – vapour pressure above a drop

A liquid with molar mass  $M = 260 \text{ g mol}^{-1}$ , density  $0.855 \text{ g cm}^{-3}$ , and surface tension  $35 \text{ mN m}^{-1}$ , was dispersed into air in the form of small droplets. Calculate the size of drops if you know that the vapour pressure above the drops is  $16.8 \text{ kPa}$ , whereas the equilibrium vapour pressure above this liquid with the planar surface has the value of  $16.54 \text{ kPa}$ , both at the temperature of  $31^\circ\text{C}$ .

$$[r = 0.54 \mu\text{m}]$$

### Problem 14-10 Kelvin equation – vapour pressure above a drop

What is the vapour pressure above the liquid drops of diameter of  $18 \text{ nm}$  at the temperature of  $35^\circ\text{C}$ ? The density of the liquid at this temperature is  $0.022 \text{ mol cm}^{-3}$ , its surface tension  $43.5 \text{ mN m}^{-1}$ , normal boiling point  $78^\circ\text{C}$ , and the vaporization enthalpy has the value of  $37.2 \text{ kJ mol}^{-1}$ . You can suppose that the vaporization enthalpy is constant and that the temperature dependence of the vapour pressure is adequately described by Clausius-Clapeyron equation.

$$[p_r^s = 20.315 \text{ kPa}]$$

### Problem 14-11 Kelvin equation – concave surface

The surface tension of nitrobenzene is  $39 \text{ mN m}^{-1}$ , its molar volume  $102.2 \text{ cm}^3 \text{ mol}^{-1}$ , and the equilibrium vapour pressure at the temperature of  $303 \text{ K}$  has the value  $p_\infty^s = 2.271 \text{ kPa}$ . At this temperature calculate the vapour pressure above the meniscus of nitrobenzene

- in a thin capillary of diameter  $0.46 \mu\text{m}$ , which is completely wetted by nitrobenzene ( $\theta = 0^\circ$ ),
- in a capillary of the same diameter but made from a material, which is not completely wetted by nitrobenzene ( $\theta = 55^\circ$ ).

$$[(a) p_r^s = 2.24 \text{ kPa}, (b) p_r^s = 2.253 \text{ kPa}]$$

### Problem 14-12 Kelvin equation – concave surface

Equilibrium vapour pressure of a liquid at the temperature of  $40^\circ\text{C}$  is  $4.2 \text{ kPa}$ . Three moles of this liquid occupy at  $40^\circ\text{C}$  the volume of  $540 \text{ cm}^3$  and its surface tension is  $48 \text{ mN m}^{-1}$ . Calculate the pressure at which will condense the vapour of the studied substance on a porous solid with cylindrical pores (see attached picture) of diameter  $6 \cdot 10^{-8} \text{ m}$ . Assume complete wetting.

$$[p_r = 3.366 \text{ kPa}]$$

## Influence of curvature on solubility

### Problem 14-13 Influence of the surface curvature on solubility

At the temperature of  $322 \text{ K}$  a solid substance in the form of large crystals dissolves to form a saturated solution of concentration  $5.2 \text{ wt. \%}$ . If we will dissolve the same substance at the same temperature in the same solvent ( $\rho^{(l)} = 0.823 \text{ g cm}^{-3}$ ), but in the form of small approximately spherical particles, the solubility will change. The interfacial tension solid/saturated solution is  $62 \text{ mN m}^{-1}$ , the studied substance does not dissociate on dissolving and its molar mass is  $M = 136 \text{ g mol}^{-1}$ . Specific area of the small particles is  $4.22 \text{ m}^2/\text{g}$ . Calculate the percentage change in solubility.

$$[100 (c_r - c_\infty)/c_\infty = 0.89 \% (c_r = 5.2463 \text{ wt. \%})]$$

### Problem 14-14 Kelvin equation – concave surface

The equilibrium solubility of an organic liquid in water at  $30^\circ\text{C}$  is  $1.7 \text{ mmol dm}^{-3}$ . The solute does not dissociate on dissolving. The solubility will be higher if the organic liquid will be dispersed in water in the form of tiny droplets. What should be the diameter of the droplets to increase the solubility at least by  $1.5 \%$ ? The density of the organic liquid is  $\rho = 0.957 \text{ g cm}^{-3}$ , its molar mass  $118 \text{ g mol}^{-1}$ , and interfacial tension between aqueous and organic phases is  $35 \text{ mN m}^{-1}$ .

$$[d = 0.46 \mu\text{m}]$$
